

**Press Release – November 2007**

## **KTX Torpedo Professional Collated Woodscrews**

Concept is proud to announce the launch of KTX Torpedo Professional Collated Woodscrews , the first really top quality professional collated woodscrews introduced into the UK and ideally suited for Concept's collated autofeed products .

The screws combine all the benefits of KTX professional woodscrews into collated woodscrews for internal and external use . The screws are the best professional collated woodscrews available today and offer some unique benefits over the competition not least of which are a stick fit in the head of the screw , a capability to handle various screw bit types and a free extended KTX bit in every box .

The screws incorporate the patented Torpedo thread that allows fast penetration into any wood type including hardwoods with very limited splitting and reduced power required to fit . The screw sizes launched are to suit various repetitive fixings tasks and will save many hours when used so providing cost savings to users .

Internal Gold is the collated screw for chipboard and plywood flooring as well as other internal applications , in 50 and 55mm and which eliminates squeaking from boards .

External Bronze is the collated woodscrew for external applications in 45 , 50 and 55 mm for use in fencing , decking and timber frame construction which has a finish which blends in beautifully with timber and which is salt spray tested to 2000 hours so guaranteeing whatever the application it will have a long life .

The main features of the screw are –

- A stick fit head with good Pozi , KTX and square drive bits so there is no rimming out or wobbling and that all the torque and rpm applied by the power tool go directly to the screw .
- A free extended KTX in every box so saving time and money buying bits and allowing the user to get straight down to work
- An extremely high manufacturing quality that means that the screws do not snap or break and even allows drilling down into hardwood without the head coming off .
- Suitability to use the screws with various bits that means that no matter what bit you have you should always be able to use KTX .

- Quality that means the screws require up to 50% less energy than other screws so making fixing easier and saving the batteries on the power tool to enable even more fixing on a battery charge
- Perhaps most importantly , having such a good collated woodscrew means that for whatever task there is significant time saving so representing a significant cost saving for users .
